## Reminder

Lecture 1

## What you should know from last lecture

- ▶ Structure of a C++ program
  - ▶ `std::string`
    - ▶ Reading strings `std::cin`
    - ▶ Writing strings `std::cout`
  - ▶ Looping and counting
    - ▶ `while`
    - ▶ `for`
  - ▶ Conditionals `if`
  - ▶ Operators
  - ▶ Built-in types

## Monte Carlo methods

---

---

---

---

---

---

---

### Monte Carlo method

**Monte Carlo methods** are computational algorithms which rely on repeated random sampling to obtain numerical results. More details [4].

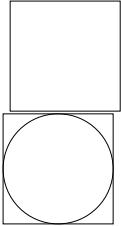

Three problem classes [2]:

1. Optimization
2. Numerical integration
3. Probability distributions

General pattern:

1. Define the input parameters
2. Randomly chose input parameters
3. Do deterministic computations on the inputs
4. Aggregate the results

### Example: Estimate the value of $\pi$

#### Ingredients

- ▶ Unit square  $1 \times 1$
- ▶ circle with the radius of  $r = 1/2$
- ▶ Area of the circle  $A_c = \pi r^2 = \pi/4$
- ▶ Area of the square  $A_s = 1 \cdot 1 = 1$
- ▶ Recall:  $A_c = \pi/4 \rightarrow \pi = 4A_c$
- ▶ Hint:  $A_c/A_s = A_c$  because  $A_s = 1$

Now compute PI by using the two areas:

$$\pi \approx 4A_c/A_s$$

The areas can be approximated by using  $N$  random samples  $(x, y)$  and count the points inside the circle  $N_c$

$$\pi \approx 4N_c/N$$

### Algorithm

1. Generate random coordinates  $(x, y) \in \mathbb{R}^2$
2. Check if  $x^2 + y^2 \leq 1$ 
  - ▶ Update  $N_c$  if  $\leq 1$
3. Increment  $n$  the interval
4. If  $n < n_{\text{total}}$  go to 1
5. Calculate  $\pi \approx 4N_c/n_{\text{total}}$
6. Print result

Interactive question:

Which features of C++ do we need?

`for, if, std::cout`, and random numbers

## Random numbers<sup>1</sup>

```
// Include for using rand
#include <cstdlib>
#include <iostream>
//Include for getting the current time
#include <ctime>

int main()
{
    // Use the current time as random seed
    std::srand(std::time(0));
    // Get one random number
    int random_variable = std::rand();
    std::cout
        << "Random value on [0 " << RAND_MAX << "]": "
        << random_variable << '\n';
}
```

More details: Section 3.2 [1] and [3]

<sup>1</sup><https://en.cppreference.com/w/cpp/numeric/random/srand>

## Uniform distributed random numbers<sup>2</sup> <sup>3</sup>

```
// Include for advanced random numbers
#include <random>
#include <iostream>

int main()
{
    //Generate a random number device
    std::random_device rd;
    //Set the standard mersenne_twister_engine
    std::mt19937 gen(rd());
    //Specify the interval [1,6]
    std::uniform_int_distribution<size_t> dis(1, 6);
    //Specify the interval [1.0,6.0]
    std::uniform_real_distribution<double> disd(1,6);
    std::cout << dis(gen) << " " << disd(gen) << '\n';
}
```

<sup>2</sup>[https://en.cppreference.com/w/cpp/numeric/random/uniform\\_int\\_distribution](https://en.cppreference.com/w/cpp/numeric/random/uniform_int_distribution)

<sup>3</sup>[https://en.cppreference.com/w/cpp/numeric/random/uniform\\_real\\_distribution](https://en.cppreference.com/w/cpp/numeric/random/uniform_real_distribution)

## Sketches for for various random numbers

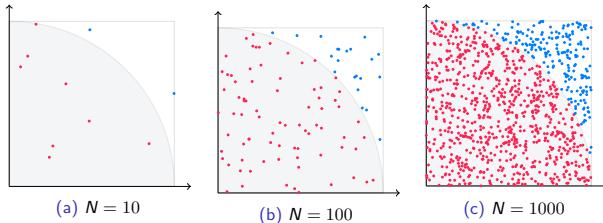

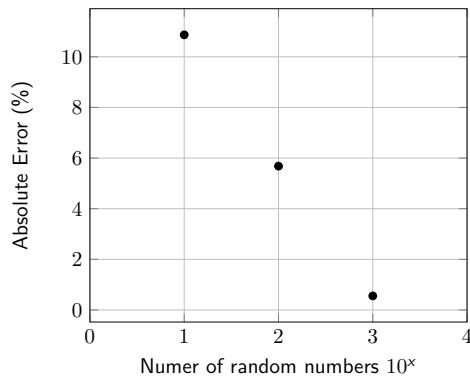

Figure: Distribution of the point inside the circle (red) and outside of the circle (blue) for  $N = 10$ ,  $N = 100$ , and  $N = 1000$  random numbers.

## How many random numbers are needed?

## Containers & Algorithms

---

---

---

---

---

---

### Computation of the average<sup>4</sup>

```
#include <iostream>
#include <iomanip>

int main()
{
    double sum = 0;
    size_t count = 0;
    double x = 0;
    while (std::cin >> x)
    {
        sum += x;
        ++count;
    }
    std::cout << "Average: "
    << std::setprecision(3)
    << sum / count << std::endl;
}
```

<sup>4</sup><https://en.cppreference.com/w/cpp/io/manip/setprecision>

### Reading multiple values

Recall: Reading one value

```
std::cin >> x
```

#### Reading multiple values

```
size_t count = 0;
double x = 0;
while (std::cin >> x)
{
    sum += x;
    ++count;
}
```

Note that the `while` loops stops by inserting `\n`

### What about computing the median?

We have to:

- ▶ We have to store all values without knowing the amount in advance
- ▶ We have to sort all the values
- ▶ We have to select the middle value(s) efficiently

What we will use:

- ▶ Containers: `std::vector` to store the elements
- ▶ Algorithm, like sorting or accumulate
- ▶ Iterators for accessing elements

## Advanced computing of the average

Notes

```
#include <iostream>
#include <vector>
#include <numeric>

int main()
{
    std::vector<double> values;
    double x;
    while (std::cin >> x)
    {
        values.push_back(x);
    }
    double sum =
    std::accumulate(values.begin(), values.end(), 0.0f);
    std::cout << "Average: "
    << sum / values.size() << std::endl;
}
```

## Initialization of Vectors<sup>5</sup>

Notes

### Initialization of an empty vector

- ▶ `std::vector<double> values;`
- ▶ `values.empty()` will return true
- ▶ `values.size()` will return zero

### Initialization

- ▶ `std::vector<double> values = {1, 2.5};`
- ▶ `values.empty()` will return false
- ▶ `values.size()` will return two

Note that C++ starts counting by 0 and the length is always number of elements minus one!

<sup>5</sup><https://en.cppreference.com/w/cpp/container/vector>

## Manipulating vectors

Notes

### Inserting

- ▶ `values.push_back(3.5);` append 3.5 at the end
- ▶ `values[3] = 1.5;` replaces the third element by 1.5

### Accessing

- ▶ `values[i]` returns element *i*
- ▶ `values.first()` returns the first element
- ▶ `values.last()` return the last element

### Deleting

- ▶ `values.pop_back();` deletes the last element
- ▶ `values.erase(values.start() + i)` deletes the *i*-th element

## Algorithms

Notes

### Accumulate<sup>6</sup>

```
double sum = std::accumulate(v.begin(), v.end(), 0.0f);
▶ The first two arguments define the range of the vector
▶ The third is the initial value of the sum
▶ The header #include <numerics> provides this functionality
```

### Sorting<sup>7</sup>

```
std::sort(s.begin(), s.end());
▶ The header #include <algorithm> provides this functionality
```

<sup>6</sup><https://en.cppreference.com/w/cpp/algorithm/accumulate>

<sup>7</sup><https://en.cppreference.com/w/cpp/algorithm/sort>

## Looping over a vector

### Notes

#### Long form

```
for( size_t i = 0; i < value.size() ; i++)
{
    values[i] *= 2;
}
```

#### Short form

```
for (auto& v : values)
{
    v *= 2;
}
```

► `auto` is equivalent to `double v : values8`

<sup>8</sup><https://en.cppreference.com/w/cpp/language/auto>

## Recall: Advanced computing of the average

### Notes

```
#include <iostream>
#include <vector>
#include <numeric>

int main()
{
    std::vector<double> values;
    double x;
    while (std::cin >> x)
    {
        values.push_back(x);
    }
    double sum =
        std::accumulate(values.begin(), values.end(), 0.0f);
    std::cout << "Average: "
        << sum / values.size() << std::endl;
}
```

## Computing the median

### Notes

Code

```
typedef std::vector<double>::size_type vec_sz;
vec_sz size = values.size();
double median = 0;
vec_sz mid = size/2;

if( size % 2 == 0 )
    median = 0.5*(values[mid] + values[mid-1]);
else
    median = values[mid];
```

#### Features

- `typedef9` is useful to not write large expression again
  - Conditional parameter<sup>10</sup>
- ```
median = size % 2 == 0 ? true : false;
```

<sup>9</sup><https://en.cppreference.com/w/cpp/language/typedef>

<sup>10</sup>[https://en.cppreference.com/w/cpp/language/operator\\_other](https://en.cppreference.com/w/cpp/language/operator_other)

## Advanced computing of the median

### Notes

```
#include <iostream>
#include <vector>
#include <algorithm>

int main(){
typedef std::vector<double>::size_type vec_sz;
std::vector<double> values;
double x;
while (std::cin >> x)
{
    values.push_back(x);
}
std::sort(values.begin(),values.end());
vec_sz mid = values.size() / 2;
double median = values.size() % 2 == 0 ?
    0.5*(values[mid]+values[mid-1]) : values[mid];
std::cout << "Median: "
    << median << std::endl;
}
```

## Functions

---

---

---

---

---

---

### Function definition<sup>11</sup>

Example: maximum

```
int max(int a, int b)
{
    return a>b?a:b;
}
```

Each function has

- ▶ a name max
- ▶ a return type int max()
- ▶ a return value return a>b?a:b;
- ▶ some function parameters max(int a, int b) or none  
max(void)

Function are defined between #include and int main (void)

---

---

---

---

---

---

<sup>11</sup>[https://en.cppreference.com/w/c/language/function\\_definition](https://en.cppreference.com/w/c/language/function_definition)

### Function definition for the median

Function definition

```
double median(std::vector<double> values)
{
    std::sort(values.begin(),values.end());
    vec_sz mid = values.size() / 2;
    double res = values.size() % 2 == 0 ?
        0.5*(values[mid]+values[mid-1]) : values[mid];

    return res;
}
```

Example

```
double result = median(values);
```

---

---

---

---

---

---

---

---

---

---

---

---

## Summary

---

---

---

---

---

---

## Summary

### Notes

After this lecture, you should know

- ▶ Monte Carlo Methods
- ▶ Random numbers
- ▶ Containers like `std::vector`
- ▶ Functions

---

---

---

---
